

Mean Shift Tracking report

Part 1

The IOU value is higher than 50% in 47.91% of the frames. This relatively lower compare to the tutorial demonstration. This is because of that the Viola-Jone detected more than 1 faces (inaccuracy) leads to lower accuracy.

Part 2

The IOU value is higher than 50% in none of these frames. This relatively lower compare to the tutorial demonstration. I think it is because of that the box from the gradient detection focus on the top of the head more often, due to more significant gradient changes there.
